Type 2213 Safety Temperature Monitor (STM)
Self-operated Regulators
Note on these mounting and operating instructions

These mounting and operating instructions assist you in mounting and operating the device safely. The instructions are binding for handling SAMSON devices.

⇒ For the safe and proper use of these instructions, read them carefully and keep them for later reference.

⇒ If you have any questions about these instructions, contact SAMSON’s After-sales Service Department (aftersalesservice@samsongroup.com).

The mounting and operating instructions for the devices are included in the scope of delivery. The latest documentation is available on our website at www.samsongroup.com > Service & Support > Downloads > Documentation.

Definition of signal words

⚠️ DANGER
Hazardous situations which, if not avoided, will result in death or serious injury

⚠️ WARNING
Hazardous situations which, if not avoided, could result in death or serious injury

⚠️ NOTICE
Property damage message or malfunction

1 Safety instructions and measures

Intended use

The Type 2213 Safety Temperature Monitor (STM) with valve is designed for temperature monitoring and control of the energy supply to heat generators (e.g. heat exchangers) by closing the valve. The connection of an additional control thermostat (e.g. Type 2231) converts the safety temperature monitor (STM) into a temperature regulator with safety temperature monitor (TR/STM).

The devices are designed to operate under exactly defined conditions (e.g. operating pressure, process medium, temperature). Therefore, operators must ensure that the devices are only used in operating conditions that meet the specifications used for sizing the devices at the ordering stage. In case operators intend to use the devices in other applications or conditions than specified, contact SAMSON.

SAMSON does not assume any liability for damage resulting from the failure to use the device for its intended purpose or for damage caused by external forces or any other external factors.

⇒ Refer to the technical data and nameplate for limits and fields of application as well as possible uses.

Reasonably foreseeable misuse

The devices are not suitable for use outside the limits defined during sizing and by the technical data. Furthermore, the following activities do not comply with the intended use:

− Use of non-original spare parts
− Performing service and repair work not described in these instructions

Qualifications of operating personnel

The devices must be mounted, started up, serviced and repaired by fully trained and qualified personnel only; the accepted industry codes and practices are to be observed. According to these mounting and operating instructions, trained personnel refers to individuals who are able to judge the work they are assigned to and recognize possible hazards due to their specialized training, their knowledge and experience as well as their knowledge of the applicable standards.
Safety instructions and measures

Personal protective equipment
We recommend checking the hazards posed by the process medium being used (e.g. GESTIS (CLP) hazardous substances database).

➢ Provide protective equipment (e.g. safety gloves, eye protection) appropriate for the process medium used.

➢ Wear hearing protection when working near the valve.

➢ Check with the plant operator for details on further protective equipment.

Revisions and other modifications
Revisions, conversions or other modifications of the product are not authorized by SAMSON. They are performed at the user's own risk and may lead to safety hazards, for example. Furthermore, the product may no longer meet the requirements for its intended use.

Warning against residual hazards
To avoid personal injury or property damage, plant operators and operating personnel must prevent hazards that could be caused in the device by the process medium, the operating pressure or by moving parts by taking appropriate precautions. They must observe all hazard statements, warning and caution notes in these mounting and operating instructions, especially for installation, start-up and service work.

We also recommend checking the hazards posed by the process medium being used (e.g. GESTIS (CLP) hazardous substances database).

➢ Observe safety measures for handling the device as well as fire prevention and explosion protection measures.

Responsibilities of the operator
The operator is responsible for proper operation and compliance with the safety regulations. Operators are obliged to provide these mounting and operating instructions as well as the referenced documents to the operating personnel and to instruct them in proper operation. Furthermore, the operator must ensure that operating personnel or third persons are not exposed to any danger.
Responsibilities of operating personnel

Operating personnel must read and understand these mounting and operating instructions as well as the referenced documents and observe the specified hazard statements, warnings and caution notes. Furthermore, the operating personnel must be familiar with the applicable health, safety and accident prevention regulations and comply with them.

Referenced standards and regulations

The devices comply with the requirements of the European Pressure Equipment Directive 2014/68/EU. Devices with a CE marking have an EU declaration of conformity, which includes information about the applied conformity assessment procedure. The EU declaration of conformity is included in the annex of these instructions (see section 10.2).

Non-electric valve versions whose bodies are not lined with an insulating material coating do not have their own potential ignition source according to the risk assessment stipulated in EN 13463-1: 2009, section 5.2, even in the rare incident of an operating fault. Therefore, such valve versions do not fall within the scope of Directive 2014/34/EU.

⇒ For connection to the equipotential bonding system, observe the requirements specified in section 6.4 of EN 60079-14 (VDE 0165-1).

Referenced documentation

The following documents apply in addition to these mounting and operating instructions:

- Mounting and operating instructions for valves, e.g. EB 2111/2121/2123
- Mounting and operating instructions for the control thermostats, e.g. EB 2231
- Mounting and operating instructions for the safety temperature limiter, e.g. EB 2046
1.1 Notes on possible severe personal injury

⚠️ DANGER

Risk of personal injury due to process medium escaping under pressure.
While removing the control thermostat/safety temperature monitor (STM)/safety temperature limiter (STL) from the valve, the sealed-off valve is opened. Residual process medium will escape and, depending on its properties, may lead to personal injury, e.g. (chemical) burns.

➔ Depressurize the plant.
➔ First start up the regulator after mounting all parts.
➔ Wear protective clothing, safety gloves and eye protection.

Risk of bursting in pressure equipment.
Valves and pipelines are pressure equipment. Improper opening can lead to valve components bursting.

➔ Before starting any work on the valve, depressurize all plant sections affected as well as the valve.
➔ Drain the process medium from all the plant sections affected as well as the valve.
➔ Wear personal protective equipment.
1.2 Notes on possible personal injury

**WARNING**

Risk of personal injury due to residual process medium in the valve and safety temperature monitor.

While working on the valve or safety temperature monitor, residual process medium can escape and, depending on its properties, may lead to personal injury, e.g. (chemical) burns.

- If possible, drain the process medium from all the plant sections affected and the valve.
- Wear protective clothing, safety gloves and eye protection.

Risk of burn injuries due to hot or cold components and pipelines.

Depending on the process medium, valve components and pipelines may get very hot or cold and cause burn injuries.

- Allow components and pipelines to cool down or heat up.
- Wear protective clothing and safety gloves.

Damage to health relating to the REACH regulation.

If a SAMSON device contains a substance which is listed as being a substance of very high concern on the candidate list of the REACH regulation, this circumstance is indicated on the SAMSON delivery note.

- Information on safe use of the part affected,
1.3 Notes on possible property damage

**NOTICE**

Risk of valve damage due to unsuitable medium properties.
The valve is designed for a process medium with defined properties.
⇒ Only use the process medium specified for sizing.

Risk of irreparable regulator damage caused by the regulator components being taken apart.
The safety temperature monitor is an inseparable hydraulic unit consisting of a safety thermostat, capillary tube and temperature sensor. If these components are dismantled (e.g. removal of the capillary tube), the regulator will be irreparably damaged and will no longer be able to fulfill its monitoring and control task.
⇒ Do not dismantle the regulator.
⇒ Only perform allowed activities on the regulator.
⇒ Contact SAMSON's After-sales Service department before replacing spare parts.

Risk of valve damage due to contamination (e.g. solid particles) in the pipeline.
The plant operator is responsible for cleaning the pipelines in the plant.
⇒ Flush the pipelines before start-up.
⇒ Observe the maximum permissible pressure for valve and plant.

Risk of damage to the valve or safety temperature monitor due to excessively high or low tightening torques.
The connection between valve and safety temperature monitor must be tightened with a certain tightening torque.
Excessively tightened torques lead to parts wearing out quicker. Parts that are too loose may cause leakage.
⇒ Observe the specified tightening torques.

Fig. 1: Nameplates
2.1 Material numbers

Specifying the configuration ID, you can contact us to find out which material is used. The configuration ID is specified on the nameplate (2 and 3 (configuration ID and device index) on the nameplate). For more details on the nameplate, see Fig. 1.

3 Design and principle of operation

See Fig. 2.

The safety temperature monitor (STM) operates according to the liquid expansion principle. The temperature sensor (12), capillary tube (9) and operating element (8) are filled with an expansion liquid.

The temperature-dependent change in volume of the liquid in the bulb sensor (12) causes the piston in the operating element (8) to move. As a result, the pin of the operating element (7) moves the plug stem (5) with the plug (3). The temperature limit can be adjusted by a key (10). This limit value is indicated on the scale (11).

The safety temperature monitor closes the valve when the temperature reaches the adjusted temperature limit. The safety temperature monitor resets itself automatically when the temperature has fallen to a value of approx. 5 K below the adjusted limit.

Fail-safe position

The spring mechanism in the operating element is released when the capillary tube breaks or when there is a leak in the sensor. It moves the plug stem (5) with the plug (3) over the pin (7) and closes and locks the valve.

Note

The adjusted limit temperature must have a minimum temperature difference of 15 K to the set point of the temperature regulator.
Fig. 2: Type 2422/2213 Safety Temperature Monitor (STM) with Type 2422 Globe Valve
3.1 Technical data

3.2 Process medium and scope of application

Safety temperature monitoring of the energy supply for heat generators or heat exchangers by closing the valve.

For limit signals from \(-10\) to \(120\,^\circ C\) \((14\) to \(248\, ^\circ F)\) · Valves DN 15 to 150 \((\text{NPS } \frac{1}{2} \text{ to } 10)\) · PN 16 to 40 \((\text{Class } 150 \text{ to } 300)\) · Max. \(350\, ^\circ C\) \((660\, ^\circ F)\)

The Type 2213 Safety Temperature Monitor (STM) with a valve operates without auxiliary energy and is designed for extended safety according to DIN EN 14597. The valve is closed by a spring mechanism when the temperature reaches the adjusted limit, when the capillary tube breaks or when leakage occurs in the sensor system. The devices are automatically reset and put back into operation after the temperature has fallen below the limit and the fault has been remedied.

When the safety temperature monitor is combined with a Type 2231 to 2235 Control Thermostat, make sure that there is a minimum difference of approximately +15 K between the adjusted limit temperature of the safety temperature monitor and the set point temperature of the control thermostat.

Dimensions and weights

Fig. 3 provides a summary of the dimensions and weights of the Type 2213 Safety Temperature Monitor as well as the Types 2111, 2422 and 2119 Valves. The lengths and heights in the dimension diagrams are shown on page 17 onwards.

Typetesting

The safety temperature monitor is tested by the German Technical Inspectorate (TÜV) according to DIN EN 14597 under the type designation 2213. The registration number is available on request.

Note

Further details and technical data of the valves and control thermostats are listed in the following mounting and operating instructions:

- Mounting and operating instructions for valves, e.g. ▶ EB 2111/2121/2123
- Mounting and operating instructions for the control thermostats, e.g. ▶ EB 2231
- Mounting and operating instructions for the safety temperature limiter, e.g. ▶ EB 2046

4 Measures for preparation

After receiving the shipment, proceed as follows:

1. Check the scope of delivery. Compare the shipment received with the delivery note.
2. Check the shipment for transportation damage. Report any damage to SAMSON and the forwarding agent (refer to delivery note).

4.1 Unpacking

Note

Do not remove the packaging until immediately before mounting it onto the valve.

Proceed as follows to lift and mount the device:

1. Remove the packaging from the device.
2. Dispose of the packaging in accordance with the valid regulations.

4.2 Transporting and lifting

Due to the low service weight, lifting equipment is not required to lift and transport the safety temperature monitor (e.g. to mount it onto the valve).

Transport instructions

− Protect the device against external influences (e.g. impact).
− Protect the device against moisture and dirt.
− Do not damage the corrosion protection (paint, surface coatings). Repair any damage immediately.
− Observe the permissible ambient temperatures (see section 3.2).

4.3 Storage

Notice

Risk of device damage due to improper storage.

− Observe the storage instructions.
− Avoid long storage times.
− Contact SAMSON in case of different storage conditions or long storage periods.

Note

We recommend regularly checking the device and the prevailing storage conditions during long storage periods.
### Measures for preparation

**Storage instructions**

- Protect the safety temperature monitor against external influences (e.g. impact).
- Do not damage the corrosion protection (paint, surface coatings). Repair any damage immediately.
- Protect the device against moisture and dirt. Store it at a relative humidity of less than 75%. In damp spaces, prevent condensation. If necessary, use a drying agent or heating.
- Make sure that the ambient air is free of acids or other corrosive media.
- Observe the permissible ambient temperatures (see section 3.2).
- Do not place any objects on the device.

#### Tip

SAMSON's After-sales Service can provide more detailed storage instructions on request.

### 4.4 Preparation for installation

Proceed as follows:

- Check to ensure that the connection for the safety temperature monitor at the valve is clean.
- Check the safety temperature monitor for damage.
- Check to make sure that the type designation, pressure rating and temperature range of the safety temperature monitor match the plant conditions (size and pressure rating of the pipeline, medium temperature etc.).
- Check any mounted thermometers to make sure they function.
5 Mounting and start-up

NOTICE
Risk of overheating due to excessive ambient temperatures or insufficient heat dissipation when components are insulated. Do not include the safety temperature monitor in the insulation of the pipeline.

5.1 Mounting the safety temperature monitor onto the valve

See Fig. 2.

The Type 2213 Safety Temperature Monitor is always installed in combination with a valve as a safety temperature regulator. The operating element with the spring mechanism (8) can be attached to the valve body using the coupling nut (6) either before or after the valve is installed in the pipeline.

Note
Put the safety temperature monitor into operation after mounting the valve and control thermostat.

The following points must be observed during installation:

- Install the valve in a horizontal pipeline with the operating element connection suspended downward (see Table 2).

NOTICE
Risk of damage to the valve or safety temperature monitor due to excessively high or low tightening torques. The connection between valve and safety temperature monitor must be tightened with a certain tightening torque. Excessively tightened torques lead to parts wearing out quicker. Parts that are too loose may cause leakage.

Observe the specified tightening torques.

5.2 Additional fittings

Strainer

A strainer installed upstream in the flow pipe holds back any dirt or other foreign particles carried along by the medium. For example, the SAMSON Type 2 NI Strainer is suitable (▶ T 1015).

The following points must be observed during installation of the strainer:

- Do not use the strainer to permanently filter the process medium.
- Install the strainer upstream of the regulator.
- Allow sufficient space to remove the filter.
- Observe the flow direction.
- In horizontal pipelines with gases or liquids, the filter element faces downward.
The filter element faces sideways in applications with steam.

- Install strainers in vertical pipelines with the medium flowing upward with the cover facing upward.

### Shut-off valve
Install a hand-operated shut-off valve both upstream of the strainer and downstream of the regulator. This allows the plant to be shut down for cleaning and maintenance, and when the plant is not used for longer periods of time.

### Thermometer
Install a thermometer both upstream and downstream of the regulator to monitor the temperatures prevailing in the plant.

---

### 5.3 Temperature sensor and capillary tube

#### NOTICE
**Risk of irreparable regulator damage caused by the regulator components being taken apart.**

*Do not separate the safety thermostat from the capillary tube or temperature sensor.*

#### Temperature sensor
The temperature sensor may be installed in either a horizontal or vertical position. However, make sure its entire length is immersed in the process medium to be controlled. It must be installed in a location where overheating or considerable idling times cannot occur.

- Weld a welding socket with G 1 female thread at the place of installation.
- Seal the sensor into welded socket.
- When a thermowell is used, we recommend filling the free space between sensor and thermowell with oil or, when installed horizontally, with grease or any other heat transfer medium to avoid delays during heat transmission. This prevents heat transfer delays. Observe the thermal expansion of the filling medium. Allow some space for expansion and do not fill the entire free space or slightly loosen sensor nut for pressure compensation.

#### NOTICE
**Galvanic corrosion due to incorrectly selected materials of the mounting parts.**

On installing the sensor or thermowell, only use similar materials (e.g. stainless steel with stainless steel or copper together with other copper materials).

#### Capillary tube
Carefully run the capillary tube (9) without bending or twisting it. Avoid locations with considerable ambient temperature fluctuations along the entire length of the tube.

#### NOTICE
*Do not damage or shorten the capillary tube. Roll up excess tube to form a ring. The smallest permissible bending radius is 50 mm.*
5.4 Electric signal transmitter

The safety temperature monitor can be fitted with an electric signal transmitter. The signal transmitter contains a microswitch (max. load 10 A, 125 V, 250 V) which generates a signal if the temperature limit is exceeded or if the sensor fails (capillary tube is broken).

Wire the microswitch according to Fig. 4.

5.4.1 Retrofitting and adjusting a signal transmitter

See Fig. 5.

Retrofitting a signal transmitter

The electric signal transmitter (order no. 1690-5724) can be fitted as follows:

1. Unfasten the four screws (1) at the connecting part and remove the scale (2).
2. Take the ready-assembled transmitter out of the packaging. Remove the two bolts (5) and nuts (6). Take the switch (3) off the scale (4).
3. Secure the scale (4) to the connecting part using the four screws (1), ensuring that the pointer (7) of the travel stem is able to move in a straight line in the middle of the left window.
4. Align the switch (3) with the scale and secure the switch to the dial plate by slightly tightening the bolts (5) and nuts (6).

Adjusting the signal transmitter

1. Reduce the limit value of the safety temperature monitor by turning the key (10 in Fig. 2) until the pointer (7) of the travel stem reaches the value '0' on the scale.
2. Connect the black and the blue wires of the supply cable to a continuity tester or a test lamp.
3. Move the switch (3) slightly until the test lamp lights up. Then tighten the bolts (5).
4. For checking purposes, increase the limit value. The test lamp should go out.

5. Reduce the limit value. The test lamp should light up again when the value '0' is indicated on the scale.

Fig. 5: Mounting an electric signal transmitter
5.5 Combination with differential pressure and flow regulators

If the safety temperature monitor is used in combination with Series 42 Differential Pressure and Flow Regulators, a separating piece must be mounted on the operating element of the safety temperature monitor to connect the actuator (Types 2424, 2427, 2428 and 2429 with force limiter).

**Note**

Before installation, remove the snap ring on the pin of the separating piece.

5.6 Start-up

**DANGER**

Risk of personal injury due to process medium escaping under pressure. First start up the regulator after mounting all parts.

**WARNING**

Risk of burn injuries due to hot or cold components and pipelines. Depending on the process medium, valve components and pipelines may get very hot or cold and cause burn injuries.
- Allow components and pipelines to cool down or heat up.
- Wear protective clothing and safety gloves.

**NOTICE**

Malfunction and damage due to adverse weather conditions (temperature, humidity). Do not install the safety temperature monitor outdoors or in rooms prone to frost. If such a location cannot be avoided, protect the regulator against freezing up if the process medium flowing through the valve can freeze up. Either heat the regulator or remove it from the plant and completely drain the residual medium.

**NOTICE**

Risk of the valve being destroyed by steam hammering.
- Drain off any condensate in the pipeline.
- Vent the plant.

⇒ Fill the plant very slowly with the process medium on start-up.

Once the safety temperature monitor is mounted onto the valve, it can be put into operation.
5.6.1 Gases and liquids

Open the shut-off valves slowly preferably starting from the upstream pressure side.
Avoid pressure surges.

5.6.2 Steam

Completely drain and dry steam lines to prevent water hammering.
Slowly allow the steam to enter the plant to ensure that the pipes and valves warm up evenly and to avoid excessive flow velocities.
Before the full capacity is reached, drain off the start-up condensate.
Make sure that the air contained in the plant escapes as quickly as possible.
Open the shut-off valves slowly preferably starting from the upstream pressure side.
Avoid pressure surges.

6.1 Adjusting the limit temperature

To adjust a different limit temperature in the safety temperature monitor, proceed as follows:

1. If the optional leading screw (13) is used, unscrew it upwards.

2. Use the key (10) to adjust the new limit value according to the dial. Slowly turn the key clockwise (\(\uparrow\)) to increase the limit temperature and counterclockwise (\(\downarrow\)) to reduce it.

3. Lift off the key (10) and screw the leading screw back into the housing, if applicable.

**Note**

When the safety temperature monitor is combined with a Type 2231 to 2235 Control Thermostat, make sure that there is a minimum difference of approximately +15 K between the adjusted limit temperature of the safety temperature monitor and the set point temperature of the control thermostat.

6 Operation

See Fig. 2.
6.2 Sensor failure

Indication of a defective sensor
In the event of a defective sensor (e.g. leakage in the sensor system), the green signal pin (8.2) disappears into the housing. In the normal state, the pin sticks out over the housing by approximately 1.5 cm.

6.3 Correcting the limit value dial

Due to ambient and temperature conditions, the adjusted limit temperature might not be the same as the temperature indicated by the reference thermometer.
To correct, proceed as follows:
1. Undo the screw labeled "Korrektur" on the back of the dial housing (14).
2. Turn the entire dial housing until the dial shows the same temperature as the reference thermometer.
   Turn clockwise (↻) to increase the limit and counterclockwise (↺) to reduce it (viewed from the front with the dial housing on top).
   A 360° turn corresponds to a limit change of approx. 1.5 K.

6.4 Fine adjustment of the limit temperature

In case you want to make fine adjustments to the safety temperature monitor or the limit value deviates, proceed as follows:

Fine adjustment using a heating bath
1. Remove the sensor from the pipeline (see section 9.1).
2. Adjust the limit temperature of the safety temperature monitor to approx. 10 K below the required limit (see section 6.1).
3. When a control thermostat is mounted on the safety temperature monitor, adjust the limit temperature to approx. 10 °C above the limit temperature.
4. Immerse the sensor of the safety temperature monitor completely into the heating bath with the correct temperature.
5. Check whether the safety temperature monitor has closed the valve (after approx. 5 min.). The travel indicator (8.3) must be at '0'.
6. **When the valve is still open:**
   slowly turn the key (10) at the safety temperature monitor clockwise (↻) to increase the limit until the valve closes.
   **When the valve is closed:**
   turn the rotary knob clockwise (↻) three more times.
7. To calibrate the limit reading to the limit temperature, perform a correction (see section 6.3).
8. When a control thermostat is mounted, readjust it to the required set point.
9. Reinstall the sensor into the pipeline (see section 5.3).
Fine adjustment using a thermometer installed in the plant

1. Adjust the limit temperature of the safety temperature monitor to approx. 10 K below the required limit (see section 6.1).

2. When a control thermostat is mounted on the safety temperature monitor, adjust the limit temperature to approx. 10 °C above the limit temperature.

3. Read the resulting temperature at the thermometer installed in the plant (after approx. 5 min.).

4. **When the limit temperature is still too low:**
   - slowly turn the key (10) at the safety temperature monitor clockwise (↻) to increase the limit until the temperature at the thermometer reaches and remains at the limit temperature.

   **After the temperature reaches the limit temperature:**
   - turn the rotary knob clockwise (↻) three more times.

5. To calibrate the limit reading to the limit temperature, perform a correction (see section 6.3).

6. When a control thermostat is mounted, readjust it to the required set point.

7 **Servicing**

The safety temperature monitor does not require any maintenance. Nevertheless, it is subject to natural wear, particularly at the soldered joints.

**WARNING**

Risk of personal injury due to residual process medium in the valve.
While exchanging the safety temperature monitor, residual process medium can escape and, depending on its properties, may lead to personal injury, e.g. (chemical) burns.
Wear protective clothing, safety gloves and eye protection.

**WARNING**

Risk of burn injuries due to hot or cold components and pipeline.
Valve components and the pipeline may become very hot or cold. Risk of burn injuries.
- Allow components and pipelines to cool down or heat up.
- Wear protective clothing and safety gloves.
Servicing

**NOTICE**

Risk of damage to the valve or safety temperature monitor due to excessively high or low tightening torques.
The connection between valve and safety temperature monitor must be tightened with a certain tightening torque. Excessively tightened torques lead to parts wearing out quicker. Parts that are too loose may cause leakage.
Observe the specified tightening torques.

**Note**
The safety temperature monitor was checked by SAMSON before it left the factory.
− Certain test results certified by SAMSON lose their validity after the safety temperature monitor is opened.
− The certification according to DIN EN 14597 loses its validity when the safety temperature monitor is opened.

**Tip**
SAMSON’s After-sales Service can support you in drawing up an inspection and test plan for your plant.

---

### 7.1 Preparation for return shipment

Defective devices can be returned to SAMSON for repair. Proceed as follows to return devices to SAMSON:

1. Put the device out of operation. See section 9.
2. Decontaminate the valve. Remove any residual process medium.
3. Fill in the Declaration on Contamination. The declaration form can be downloaded from our website at www.samsongroup.com > Services > Check lists for after sales service > Declaration on Contamination.
8 Malfunctions

The malfunctions listed in Table 5 are caused by mechanical faults and incorrect regulator sizing. In the simplest case, the functioning can be restored following the recommended action. Special tools may be required for repair work.

Exceptional operating and installation conditions may lead to changed situations that may affect the control response and lead to malfunctions. For troubleshooting, the conditions, such as installation, process medium, temperature and pressure conditions, must be taken into account.

SAMSON’s After-sales Service can help during troubleshooting. Further information is available in section 10.

Tip

SAMSON’s After-sales Service can support you in drawing up an inspection and test plan for your plant.

Note

Contact SAMSON’s After-sales Service for malfunctions not listed in the table.

Note

If the hydraulic system of the Type 2213 is defective (pressure loss), the STM cannot be unlocked as a result. It must be replaced with a new device.

9 Decommissioning and removal

⚠️ DANGER

Risk of bursting in pressure equipment.
Valves and pipelines are pressure equipment. Improper opening can lead to bursting of the valve.

- Before starting any work on the valve, depressurize all plant sections affected as well as the valve.
- Drain the process medium from all the plant sections affected as well as the valve.
- Wear personal protective equipment.

⚠️ DANGER

Risk of personal injury due to process medium escaping under pressure.
While removing the control thermostat/safety temperature monitor (STM)/safety temperature limiter (STL) from the valve, the sealed-off valve is opened. Residual process medium will escape and, depending on its properties, may lead to personal injury, e.g. (chemical) burns.
- Depressurize the plant.
- Wear protective clothing, safety gloves and eye protection.

</tbody>
</table>
9.1 Decommissioning

To decommission the safety temperature monitor before removing it, proceed as follows:

1. Close the shut-off valve on the upstream side of the valve.
2. Close the shut-off valve on the downstream side of the valve.
3. Completely drain the pipelines and valve.
4. Depressurize the plant. Shut off or disconnect the control line, if installed.
5. If necessary, allow the pipeline and device to cool down or heat up.
6. Remove the sensor from the pipeline and, if necessary, seal the opening.
7. Remove the safety temperature monitor from the valve.

WARNING
Risk of personal injury due to residual process medium in the valve and safety temperature monitor.
While working on the valve or safety temperature monitor, residual process medium can escape and, depending on its properties, may lead to personal injury, e.g. (chemical) burns.
Wear protective clothing, safety gloves and eye protection.

WARNING
Risk of burn injuries due to hot or cold components and pipeline.
Valve components and the pipeline may become very hot or cold. Risk of burn injuries.
- Allow components and pipelines to cool down or heat up.
- Wear protective clothing and safety gloves.
Annex

9.2 Disposal

→ Observe local, national and international refuse regulations.

→ Do not dispose of components, lubricants and hazardous substances together with your household waste.

10 Annex

10.1 After-sales service and spare parts

After-sales service

Contact SAMSON’s After-sales Service for support concerning service or repair work or when malfunctions or defects arise.

E-mail address

You can reach our after-sales service at aftersalesservice@samsongroup.com.

Addresses of SAMSON AG and its subsidiaries

The addresses of SAMSON, its subsidiaries, representatives and service facilities worldwide can be found on our website (www.samsongroup.com) or in all SAMSON product catalogs.

To assist diagnosis and in case of an unclear mounting situation, specify the following details (so far as possible). See section 2:

− Device type and nominal size
− Model number and configuration ID
− Upstream and downstream pressure
− Temperature and process medium
− Min. and max. flow rate
− Is a strainer installed?
− Installation drawing showing the exact location of the regulator and all the additionally installed components (shut-off valves, pressure gauge etc.)
Spare parts
There are no spare parts available for the safety temperature monitor.

10.2 Certificates
The EU declarations of conformity are included on the next pages.
