Position Transmitter
Type 4748

Mounting and Operating Instructions

EB 8363 EN
Edition December 2007
General safety instructions

The position transmitter may only be assembled, started up or operated by trained and experienced personnel familiar with the product. According to these mounting and operating instructions, trained personnel is referred to as individuals who are able to judge the work they are assigned to and recognize possible dangers due to their specialized training, their knowledge and experience as well as their knowledge of the relevant standards.

Explosion-protected versions of this device may only be operated by personnel who have undergone special training or instructions or who are authorized to work on explosion-protected devices in hazardous areas.

Any hazards that could be caused by the process medium, the operating pressure, the signal pressure or by moving parts of the control valve are to be prevented by means of the appropriate measures. If inadmissible motions or forces are produced in the actuator as a result of the supply pressure level, it must be restricted by means of a suitable supply pressure reducing station.

Proper shipping and appropriate storage are assumed.

Note!
The device with a CE marking fulfils the requirements of the Directives 94/9/EC (ATEX) and 89/336/EEC (EMC).

1 Design and principle of operation

The Type 4748 Position Transmitter is used to assign a certain relationship between the valve position (travel) and the analog output signal of 4 to 20 mA. If the output signal is transmitted to an indicating instrument, the present travel position can be monitored. The position transmitter is attached to the control valve either directly or in combination with the Type 4763 and Type 4765 Positioner.

The pin (1.1) and the lever (1) convert the travel of the control valve into a rotary motion which is transmitted to the solenoid sys-

3) At max. travel 100 % = 8° lever angle
tem (2) of the position transmitter. This causes a change in the magnetic field as well as in the voltage in the sensor (2.1) that operates according to the Hall effect. The connected electronics unit converts the resulting voltage into a load-independent current signal of 4 to 20 mA.

To adjust zero and span, the position transmitter has 4 microswitches for initial adjustment and 2 potentiometers for fine adjustment. The output characteristic of the position indication may be reversed by a connector that can be turned by 180°. By doing this, the closed position of the valve may optionally be represented by a current signal of either 4 mA or 20 mA.

2 Attachment

The accessories listed in the table below are required for attachment.

2.1 Attachment to control valve

The required lever (I or II) must be mounted to the control valve prior to attaching the position transmitter (refer to Fig. 3). To do this, push the clamping plate (1.1) over the lever (1) and place them together on the shaft. Tighten the fastening screw.

2.1.1 Attachment to valve with cast yoke

1. Fasten the plate (10) to the stem connector clamp of the valve using the screws (10.1).
2. Fasten the pin (11) to the plate (10) using the two nuts (11.1).
3. Unscrew the cover of the position transmitter. Fasten it to the valve yoke using the screw (12), washer (13) and O-ring (14). Make sure that the pin (11) is located inside the wire bracket (1.3) of the lever (1).

2.1.2 Attachment to valve with rod-type yoke

1. Fasten plate (10) to the stem connector clamp of the valve using screws (10.1) (refer to Fig. 3).
2. Fasten the pin (11) to the plate (10) using the two nuts (11.1).
3. Place the support (15) and fixing plate (16) on the valve stem and fasten lightly. Move the support until the middle of the plate (10) and the support (15) are aligned when the valve is at mid-travel.

2.2  Attachment to positioner

For attachment to the Type 4765 and Type 4763 Positioner with a short lever, proceed as follows:
Place O-rings (30) on the left and the right side of the intermediate piece (31). Insert the two fillister head screws (33) in the position transmitter and the intermediate piece, and put them to the positioner. Slip the nuts (32) on the fillister head screws in the positioner housing and tighten the screws (33). Fasten the pin (1.3) to the lever (1) of the positioner using the nuts (22), linking the short lever of the position transmitter with it.

Both devices have the degree of protection IP 54. For this purpose, exchange the stoppers from the positioner cover and the position transmitter cover.
To achieve IP 65: Replace venting of the position transmitter with a filter (order no. 1790-7408).

2.3  Housing cover

After mounting the position transmitter on the control valve, ensure that the vent plug in the housing cover points downwards.

Fig. 4 · Attachment with intermediate piece, e.g., on Type 4765 or Type 4763 Positioner
3 Electrical connection

The terminal assignment can be found in Fig. 5 or on the printed circuit board.

To check the output signal during adjustment, connect an ammeter (mA scale) to the terminals 81 and 82 after temporarily removing the jumper.

A two-wire system is used to operate the position transmitter. The supply voltage usually is 24 V DC. Considering the wire resistance, the voltage directly applied to the terminals of the position transmitter must be between min. 12 to max. 45 V DC.

When used in hazardous areas, observe the installation regulations according to VDE 0165.

4 Operation

4.1 Adjusting the position transmitter

4.1.1 Direction of action

A travel of 0 to 100 % can be assigned to a feedback signal (direction of action either >> or <>) range of 4 to 20 mA or 20 to 4 mA.

The feedback signal range depends upon the mounting position (direct attachment on the left or the right side of the control valve or attachment to the positioner) as well as upon the type of actuator ("Actuator stem retracts" or "Actuator stem extends"). The desired direction of action of the output signal is determined by the 7-pole connector on the PCB (see table on page 8) and indicated by the symbols on the connector >> or <>

To change the direction of action, gently lever off the connector and remove it. Then, turn it by 180° and plug it in again.

4.2 Adjusting zero and span

ZERO: Use the switches 3 and 4 for initial adjustment of zero point. For fine adjustment, use the ZERO potentiometer. Usually, the zero point is based on 4 mA.

SPAN: Use the switches 1 and 2 for initial adjustment of the span and the upper range value. For fine adjustment, use the SPAN potentiometer. The span is usually based on 20 mA.
Example:
With a control valve which is moved from the closed position (Valve CLOSED) to the open position (Valve OPEN), the feedback signal should pass through the signal range from 4 to 20 mA. The position transmitter is attached to the left side of the control valve. To carry out adjustments at the terminals 31 and 32, connect a suitable ammeter. To check the output signal, remove the jumper at the terminals 81 and 82 and connect a suitable ammeter (mA scale). First determine the direction of action by setting the position of the 7-pole connector. Applying the example above, the symbol on the connector must be <> according to the table (on page 8). If this is not the case, remove the connector, turn it 180° and plug it in again.

4.2.1 Zero adjustment
Move the control valve to the closed position (Valve CLOSED = travel 0 %) over the input signal of the positioner. Take the reading from the ammeter. The reading must be approx. 4 mA. Upon slight deviation, carry out correction at the ZERO potentiometer until the reading is 4 mA. On considerable deviation, adjust the switches 3 and 4 until the issued mA value lies within the adjusting range of the ZERO potentiometer. Set the zero point exactly to 4 mA by adjusting the ZERO potentiometer.

4.2.2 Span adjustment
Move the control valve to the fully open position (Valve OPEN = travel 100 %) over the input signal of the positioner. Take the reading from the ammeter. The reading must be approx. 20 mA. On slight deviation, carry out correction at the SPAN potentiometer until the reading is 20 mA.
Upon considerable deviation, adjust the switches 1 and 2 until the issued mA value lies within the adjusting range of the SPAN potentiometer. Finally, adjust the SPAN potentiometer until the ammeter exactly reads 20 mA. Since zero and span adjustment affect each other, re-adjust the potentiometers until both values are correct.

Schedule

Description of Equipment

The Model 4748-1.. Position Indicator serves for monitoring the valve stem position. The voltage change produced by a Hall sensor due to the change in position of a permanent magnet dependent on the valve stem position is converted into the standard signal of 4 to 20 mA and fed to the downstream transducer electronics.

The Model 4748-1.. Position Indicator is a passive two-terminal network which may be connected to any intrinsically safe circuit, provided the permissible maximum values of Ui, li and Pi are not exceeded.

For air supply non-combustible media are used.

The device may be used inside and outside of hazardous locations.

The correlation between temperature classification and permissible ambient temperature range is shown in the table below:
