

T 2523 EN

Type 2406 Excess Pressure Valve

Self-operated Pressure Regulators · ANSI version

Application

Excess pressure valve for set points from **0.075 to 150 psi/5 mbar** to 10 bar · Valve size **NPS ½ to 2/DN 15 to 50** ¹⁾
 Pressure rating **Class 125 to 300/PN 16 to 40** · Suitable for gases at temperatures from **-5 to +140 °F · 32 to 300 °F/**
-20 to +60 °C · 0 to 150 °C ²⁾

The valve **opens** when the upstream pressure **rises**.

This regulator is used to control the pressure of flammable gases used as a source of energy, e.g. in boilers, driers, vaporizers, heat exchangers or industrial ovens. Alternatively, it can control the compressed air supply in process engineering applications.

An additional application of the regulator is the pressure control of inert gas used for inerting or blanketing reaction or storage tanks to protect the product in the tank from oxidation, explosion or escaping. To achieve an economical consumption of the inert gas, its pressure must be controlled to always remain slightly higher than atmospheric pressure while the tank is being filled or emptied.

Special features

- Low-maintenance proportional regulators
- Compact regulator design providing excellent control accuracy
- Internal set point springs with set point adjustment using a nut on the actuator
- Spring-loaded, single-seated valve balanced by a balancing diaphragm
- External connection of a control line
- Meets strict emission requirements (TA Luft)
- Minimum leakage class IV
- Suitable for use as a vacuum breaker

Version

Valves in NPS ½ to 2/DN 15 to 50 · Flanged connections
 Soft-seated plug · Body made of cast iron, cast steel or cast stainless steel

¹⁾ NPS ½ and ¾ not in Class 125

²⁾ For unbalanced versions with FKM diaphragm and FKM soft seal

Fig. 1: Type 2406 Excess Pressure Valve

Special versions

- Version with FDA-compliant materials for the food and pharmaceutical industries
- NACE version for sour gas applications
- Actuator with seal and leakage line connection (also as vacuum breaker)
- Version with connected control line. Pressure tapped directly at the valve body

Principle of operation

The medium flows through the valve in the direction indicated by the arrow. The position of the plug determines the flow rate across the area released between plug (3) and valve seat (2).

In the pressureless state (control line not connected and no pressure applied) the valve is closed by the force of the set point spring (7).

The upstream pressure p_1 to be controlled is tapped upstream of the valve and transmitted over the control line ¹⁾ to the actuator where it is converted into a positioning force. This force is used to move the valve plug according to the force of the set point spring (7).

The spring force is adjustable at the set point nut (8). When the force resulting from the upstream pressure p_1 rises above the adjusted set point, the valve opens proportionally to the change in pressure.

In the version with pressure balancing, the forces produced by the upstream and downstream pressures acting on the plug are eliminated by the balancing diaphragm (10). The plug is fully balanced.

¹⁾ Optional: pressure tapping directly at the valve body

Seal	EPDM · FKM · NBR	
Balancing diaphragm	EPDM · FKM · NBR	
Actuator housing	1.0332	1.4301
Operating diaphragm	EPDM · FKM · NBR	

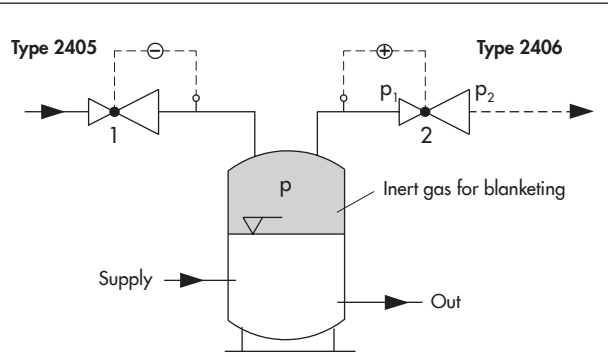

Installation

The regulator is preferably to be installed in horizontal pipelines:

- Actuator housing on top of the valve, actuator facing upwards
- The direction of flow must match the direction indicated by the arrow on the body.
- In applications in which the blanketing gas can liquefy, condensate may form in the control line, causing damage to the regulator. To allow condensate to run back into the tank, install the control line with an approximate 10 % slope to the pressure tapping point at the tank.
- Distance between the pressure tapping point and regulator min. 2 x NPS (2 x DN).

In exceptional cases, the regulator can also be installed in vertical pipelines with the direction of flow from the top (see ► EB 2522 for more details).

If the pressure p of the inert gas in the tank falls below the set point p_1 adjusted at the **Type 2405** Pressure Reducing Valve (1), it opens to allow more gas to enter the tank. The valve (1) closes again when the pressure p of the blanketing gas has been reestablished.
If the pressure is too high, the inert gas is vented off over the **Type 2406** Excess Pressure Valve (2).

Fig. 3: Sample application, Type 2406 used for vapor recovery

Dimensional drawings

The control line connection is turned by 90° in the drawing. The connection is normally located opposite the side with the arrow indicating the direction of flow.

An adapter G 1/4 to 1/4-18 NPT (order no. 0230-3417) must be ordered separately.
