

Series 240

Type 3241-1-Gas and Type 3241-7-Gas Automatic Shut-off Valves for Gases (valve class D)

DIN-DVGW typetested acc. to DIN EN 161 (2013-04)

Application

Control valve for control systems subject to the special safety requirements governing gas supply

For gaseous fuels according to Gas Appliances Regulation 2016/426/EU.

DN 15 to 150 · PN 40 · -20 to +220 °C

Automatic shut-off valve (Type 3241 Globe Valve) with:

- Type 3271 Pneumatic Actuator (Type 3241-1 Control Valve)
- Type 3277 Pneumatic Actuator for integral positioner attachment (Type 3241-7 Control Valve)

With mounted pilot valve (3/2-way solenoid valve) and a strainer (▶ T 1015).

The safety control valves, typetested according to DIN EN 161 (2013-04), are used to control the pressure, temperature or flow rate of gas-burning appliances. In the event of a malfunction, the valves shut off the gas supply. They meet the strict leakage requirements of Class D.

Valve body with undivided bonnet made of:

- Cast steel or cast stainless steel
- Forged steel 1.0460 (C 22.8) or 1.4571

The control valves, designed according to the modular assembly principle, can be equipped with various accessories according to IEC 60534-6-1¹⁾ and NAMUR recommendation (see Information Sheet ▶ T 8350).

Version

Standard version for temperatures from -20 to +220 °C, body materials according to Table 3 · With soft-seated plug and bellows seal · With pneumatic actuator with pilot valve mounted on it and "fail-close" action · With Type 2 NI Strainer

- **Type 3241-1-Gas** · Automatic shut-off valve with Type 3271 Actuator (see Data Sheet ▶ T 8310-1)
- **Type 3241-7-Gas** · Automatic shut-off valve with Type 3277 Actuator (see Data Sheet ▶ T 8310-1)

Further versions

- **Typetested for heating systems** · See Data Sheet ▶ T 8016
- **ANSI version**

Fig. 1: Type 3241-7-Gas with Type 3963 Solenoid Valve and Type 3730 Positioner

¹⁾ Accessories required. See associated actuator documentation.

Principle of operation

The process medium flows through the strainer and the valve in the direction indicated by the arrow. The plug stem is sealed by the metal bellows and a backup packing. The test connection enables the bellows to be monitored for leakages.

The signal pressure p_{st} is applied to the pilot valve (11) whose coil is connected to the safety interlock circuit (switch 14, Fig. 3 and Fig. 4). During operation, the coil is energized and the signal pressure p_{st} acts on the diaphragm. In the event of a malfunction, the pilot valve is activated and the pressure acting on the diaphragm is relieved, causing the control valve to close quickly.

DIN DVGW test mark

The valves were typetested by TÜV (German technical surveillance association) and received the test mark by DVGW (German Technical and Scientific Association for Gas and Water) as specified in Table 1.1.

Installation

Install the valves in horizontal pipelines in an upright position (diaphragm actuator on top). The process medium must flow through the valve in the direction indicated by the arrow.

Prior to start-up, make sure that the vent of the pilot valve and the pressure connection on the top case of the actuator are open.
